MITIGATING GRID DELAY

PRIORITY ISSUE:

GRID DELAYS HAMPER CONSTRUCTION PROGRESS

A delay in connection to the grid can cause significant setbacks to offshore wind farms in construction, resulting in extended, subsequently costly idling periods and warranty concerns. Maintaining a temporary power supply is essential to allow developers to make the best use of idling periods.

SUPPORTING YOUR SUCCESS

CWind's Grid Delay Mitigation programme reduces the risk of turbine failure and keeps your warranties intact. By managing idling works until hot commissioning, we manage power access on the towers and carry out cold commissioning works, so power can be generated as soon as possible once grid connection is established.

EVERYTHING YOU'LL NEED FROM ONE SOURCE

Combine traditional temporary power solutions with a pro-active idling works package to reduce grid related delay and accelerate project delivery as much as possible.

- Experienced technicians, equipment, refueling, maintenance & repair, project managed by us
- Structural strength, paintworks, lifting, climbing & safety equipment inspections & repair
- Experienced tower teams for export & array cable pull-ins & repairs
- ROV/AUV subsea cable surveys, additional deckhands
- Substantial fleet of wind farm support vessels, large & flexible payload
